PROFESSIONAL SUMMARY

Python and Django developer with hands-on experience building full-stack web applications using Django, SQLite, PostgreSQL, HTML, CSS, and JavaScript. Developed two end-to-end web applications including a URL shortener and a student result management system, covering database design, Django ORM, Git-based version control, and production deployment on Render.

TECHNICAL SKILLS

- Languages: Python, JavaScript (Fundamentals), HTML5, CSS3, SQL
- Framework: Django
- Databases: SQLite, PostgreSQL
- Tools: Git, GitHub, VS Code, Render, WhiteNoise, python-dotenv
- Concepts: Django ORM, CRUD operations, MVT architecture, URL routing, Django templates & forms, Django Admin, responsive web design, static file management, environment variables (.env), secret key management

PROJECTS

CineMatch — Movie Recommendation Engine | Python, Django, Pandas, scikit-learn, Surprise (SVD), HTML5, CSS3, JavaScript

- Built a movie recommendation engine using two collaborative filtering approaches — user-based cosine similarity and SVD matrix factorization — trained on the MovieLens dataset (100,836 ratings, 610 users, 9,742 movies).
- Evaluated both models with RMSE and Precision@10 on a held-out test set; SVD outperformed cosine similarity (RMSE 0.8848 vs. 1.0781, Precision@10 0.0484 vs. 0.0410) and was selected for production.
- Optimized the evaluation pipeline with dictionary-based caching, cutting full model evaluation time from over 40 minutes to a few minutes.
- Designed a cold-start solution mapping anonymous visitors to their most similar existing rated-user profile for instant personalized recommendations.
- Built a Django backend with REST-style JSON APIs and a relational database, plus a responsive HTML5/CSS3/JavaScript frontend with live search and dynamic recommendation rendering via the Fetch API.

SnapLink — URL Shortener | Python, Django, PostgreSQL, HTML5, CSS3, Git, GitHub

- Built a URL shortening web application using Django that generates custom short links and redirects users to their original URLs via a database-backed lookup.
- Designed a URL redirection workflow that retrieves the destination URL from PostgreSQL using Django ORM before issuing an HTTP redirect.
- Added custom alias support and server-side validation to prevent duplicate aliases.
- Designed a responsive landing page with a recent-links section and input validation feedback.
- Managed source code with Git and GitHub, including resolving merge conflicts.

College Result Management System | Python, Django, SQLite, HTML5, CSS3, JavaScript, Render, WhiteNoise

- Built a Django-based student result portal that retrieves examination records from a relational database using Hall Ticket Number lookup.
- Designed a database schema with 5 student-related fields, including Hall Ticket Number, subject marks, total marks, and result status.
- Implemented Django views, URL routing, and Admin Panel configuration for managing student records.
- Built 5 responsive templates using Django Template Language.
- Configured the application for production (WhiteNoise, environment variables) and deployed it on Render, managing source code with Git and GitHub throughout.

EDUCATION

BSc Physical Sciences (Mathematics, Statistics, Computer Science)

Final Year — Expected 2027

BJR Government Degree College, Hyderabad

Intermediate (MPC), Board of Intermediate Education, Telangana

2023 — 70.8%

Sai Chaitanya Jr. College, Hyderabad

Secondary School Certificate (SSC), Board of Secondary Education, Telangana

2021 — 100%

Hyderabad Sainik School, Hyderabad

CERTIFICATION

- Python Web Development Course — Siasat
